## SMART CONTRACT SECURITY AUDIT OF

  
SKEPTIC

SMART CONTRACT AUDIT | SOLIDITY DEVELOPMENT & TESTING | PROJECT EVALUATION

RELENTLESSLY SECURING THE PUBLIC BLOCKCHAIN

# Audit Introduction

**Auditing Firm** InterFi Network

**Audit Architecture** InterFi Echelon Auditing Standard

**Language** Solidity

**Client Firm** Skeptic Token

**Website** <https://defiskeptic.com>

**Telegram** <https://t.me/SkepticToken>

**Twitter** <https://twitter.com/DeFiSkeptic>

**Report Date** May 12, 2022

## About Skeptic Token

DeFi Skeptic is a platform that seeks to reduce fraud while increasing transparency in the DeFi space. It will do this by providing various products and services powered by Skeptic Token (SKP) which is a multi-use, liquidity backed token with a unique deflationary mechanism that is not volume dependent which they call the "Burn Fund".

# Audit Summary

InterFi team has performed a line-by-line manual analysis and automated review of smart contracts. Smart contracts were analyzed mainly for common contract vulnerabilities, exploits, and manipulation hacks. According to the audit:

- ❖ Skeptic Token's solidity source code has **LOW RISK SEVERITY**
- ❖ Skeptic Token's smart contract has an **ACTIVE OWNERSHIP**
- ❖ Skeptic Token's centralization risk correlated to the active owner is **MEDIUM**

Be aware that smart contracts deployed on the blockchain aren't resistant to internal exploit, external vulnerability, or hack. For a detailed understanding of risk severity, source code vulnerability, exploitability, and audit disclaimer, kindly refer to the audit.

 Contract address: **0x745f861478090eD122e669EcAfDa156490247D6C**

 Blockchain: **Binance Smart Chain**

 Verify the authenticity of this report on InterFi's GitHub: <https://github.com/interfinetwork>

# Audit Scope

InterFi was consulted by Skeptic Token to conduct the smart contract security audit of their solidity source codes. The audit scope of work is strictly limited to the mentioned solidity file(s) only:

- ❖ Skeptic.sol

## **Solidity Source Code On Blockchain (Verified Contract Source Code)**

<https://bscscan.com/address/0x745f861478090eD122e669EcAfDa156490247D6C#code>

Contract Name: Skeptic

Compiler Version: v0.8.13

Optimization Enabled: Yes with 5000 runs

## **Solidity Source Code On InterFi GitHub**

<https://github.com/interfinetwork/audited-codes/blob/main/Skeptic.sol>

## **Payment Verification**

Network: Binance Smart Chain

Hash: 0x3dc23dc19ad5e921d6e30dc66d1d09529a138744f9977d20f279855b3730d23d

## **SHA-1 Hash**

Solidity source code is audited at hash #ff97e4c02f0ad7d3af59b662e6102d78dc97c142

# Audit Methodology

The scope of this report is to audit the smart contract source code of Skeptic Token. InterFi has scanned contracts and reviewed codes for common vulnerabilities, exploits, hacks, and backdoors. Due to being out of scope, InterFi has not tested contracts on testnet to assess any functional flaws. Below is the list of commonly known smart contract vulnerabilities, exploits, and hacks:

## Category

---

### Smart Contract Vulnerabilities

- ❖ Re-entrancy
- ❖ Unhandled Exceptions
- ❖ Transaction Order Dependency
- ❖ Integer Overflow
- ❖ Unrestricted Action
- ❖ Incorrect Inheritance Order
- ❖ Typographical Errors
- ❖ Requirement Violation
- ❖ Gas Limit and Loops
- ❖ Deployment Consistency
- ❖ Repository Consistency
- ❖ Data Consistency
- ❖ Token Supply Manipulation
- ❖ Access Control and Authorization
- ❖ Operations Trail and Event Generation
- ❖ Assets Manipulation
- ❖ Ownership Control
- ❖ Liquidity Access

### Source Code Review

## **InterFi's Echelon Audit Standard**

The aim of InterFi's "Echelon" standard is to analyze smart contracts and identify the vulnerabilities and the hacks. Kindly note, InterFi does not test smart contracts on testnet. It is recommended that smart contracts are thoroughly tested prior to the audit submission. Mentioned are the steps used by InterFi to audit smart contracts:

1. Solidity smart contract source code review:
  - ❖ Review of the specifications, sources, and instructions provided to InterFi to make sure we understand the size, and scope of the smart contract audit.
  - ❖ Manual review of code, which is the process of reading source code line-by-line to identify potential vulnerabilities.
2. Static, Manual, and Software analysis:
  - ❖ Test coverage analysis is the process of determining whether the test cases are covering the code and how much code is exercised when we run those test cases.
  - ❖ Symbolic execution is analyzing a program to determine what inputs cause each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts

## **Automated 3P frameworks used to assess the smart contract vulnerabilities**

- ❖ ConsenSys Tools
- ❖ SWC Registry
- ❖ Solidity Coverage
- ❖ Open Zeppelin Code Analyzer
- ❖ Solidity Code Complier

# Risk Classification

Smart contracts are generally designed to manipulate and hold funds denominated in ETH/BNB. This makes them very tempting attack targets, as a successful attack may allow the attacker to directly steal funds from the contract. Below are the typical risk levels of a smart contract:

**Vulnerable:** A contract is vulnerable if it has been flagged by a static analysis tool as such. As we will see later, this means that some contracts may be vulnerable because of a false positive.

**Exploitable:** A contract is exploitable if it is vulnerable and the vulnerability could be exploited by an external attacker. For example, if the “vulnerability” flagged by a tool is in a function that requires owning the contract, it would be vulnerable but not exploitable.

**Exploited:** A contract is exploited if it received a transaction on the main network which triggered one of its vulnerabilities. Therefore, a contract can be vulnerable or even exploitable without having been exploited.

Risk severity	Meaning
<b>! High</b>	This level vulnerabilities could be exploited easily and can lead to asset loss, data loss, asset, or data manipulation. They should be fixed right away.
<b>! Medium</b>	This level vulnerabilities are hard to exploit but very important to fix, they carry an elevated risk of smart contract manipulation, which can lead to high-risk severity
<b>! Low</b>	This level vulnerabilities should be fixed, as they carry an inherent risk of future exploits, and hacks which may or may not impact the smart contract execution.
<b>! Informational</b>	This level vulnerabilities can be ignored. They are code style violations and informational statements in the code. They may not affect the smart contract execution

# Centralization Risk

Centralization risk is the most common cause of decentralized finance hacks. When a smart contract has an active contract ownership, the risk related to centralization is elevated. There are some well-intended reasons to be an active contract owner, such as:

- ❖ Contract owner can be granted the power to `pause()` or `lock()` the contract in case of an external attack.
- ❖ Contract owner can use functions like, `include()`, and `exclude()` to add or remove wallets from fees, swap checks, and transaction limits. This is useful to run a presale, and to list on an exchange.

Authorizing a full centralized power to a single body can be dangerous. Unfortunately, centralization related risks are higher than common smart contract vulnerabilities. Centralization of ownership creates a risk of rug pull scams, where owners cash out tokens in such quantities that they become valueless. **Most important question to ask here is, how to mitigate centralization risk?** Here's InterFi's recommendation to lower the risks related to centralization hacks:

- ❖ Smart contract owner's private key must be carefully secured to avoid any potential hack.
- ❖ Smart contract ownership should be shared by multi-signature (multi-sig) wallets.
- ❖ Smart contract ownership can be locked in a contract, user voting, or community DAO can be introduced to unlock the ownership.

## Skeptic Token's Centralization Status

- ❖ Skeptic Token's smart contract has an **active ownership**.
- ❖ Smart contract ownership is set to **0x8c91615020cb67224d2d3100f596628da3ce4591** at the time of the audit.

## Inheritance Graph

# Manual Analysis

Function	Description	Available	Status
<b>Total Supply</b>	provides information about the total token supply	Yes	Passed
<b>Balance Of</b>	provides account balance of the owner's account	Yes	Passed
<b>Transfer</b>	executes transfers of a specified number of tokens to a specified address	Yes	Passed
<b>Approve</b>	allow a spender to withdraw a set number of tokens from a specified account	Yes	Passed
<b>Allowance</b>	returns a set number of tokens from a spender to the owner	Yes	Passed
<b>Buy Back</b>	is an action in which the project buys back its tokens from the existing holders usually at a market price	NA	NA
<b>Burn</b>	executes transfers of a specified number of tokens to a burn address	Yes	Passed
<b>Mint</b>	executes the creation of a specified number of tokens and adds it to the total supply	NA	NA
<b>Rebase</b>	circulating token supply adjusts (increases or decreases) automatically according to a token's price fluctuations	NA	NA
<b>Dividend</b>	executes transfers of a specified dividend token to a specified address	Yes	Passed
<b>Lock / Pause</b>	locks or pauses all or some function modules of the smart contract	NA	NA

Function	Description	Tested	Verdict
<b>Blacklist</b>	stops specified wallets from interacting with the smart contract function modules	Yes	Passed
<b>Airdrop</b>	executes transfers of a specified number of tokens to a specified address	Yes	Passed
<b>Max Transaction</b>	a non-whitelisted wallet can only transfer a specified number of tokens	NA	NA
<b>Max Wallet</b>	a non-whitelisted wallet can only hold a specified number of tokens	Yes	Passed
<b>Contract Fees</b>	executes fee collection from swap events and/or transfer events	Yes	Passed
<b>Cooldown Timer</b>	functionality to limit the number of transactions that a wallet can make within 24-hours .....	Yes	Passed
<b>Anti Snipe</b>	stops some or all bot wallets from sniping the smart contract	Yes	Passed
<b>Transfer Ownership</b>	executes transfer of contract ownership to a specified wallet	Yes	Passed
<b>Renounce Ownership</b>	executes transfer of contract ownership to a dead address	Yes	Passed

## Notable Information

- ❖ Smart contract owner can **set swap settings and enable swap status.**

```
function setSwapSettings(uint256 thresholdPercent, uint256 thresholdDivisor, uint256
amountPercent, uint256 amountDivisor) external onlyOwner
    require(swapThreshold <= swapAmount, "Threshold cannot be above amount.");
    function setContractSwapEnabled(bool swapEnabled, bool priceImpactSwapEnabled) external
onlyOwner {
    contractSwapEnabled = swapEnabled;
```

- ❖ Smart contract utilizes **safemath** function to avoid common smart contract vulnerabilities.

```
string private _name = "Skeptic Token";
library SafeMath {
function add(uint256 a, uint256 b) internal pure returns (uint256) {
    uint256 c = a + b;
    require(c >= a, "SafeMath: addition overflow");
function sub(uint256 a, uint256 b) internal pure returns (uint256) {
    return sub(a, b, "SafeMath: subtraction overflow");
    uint256 c = a * b;
    require(c / a == b, "SafeMath: multiplication overflow");
    return c;
function div(uint256 a, uint256 b) internal pure returns (uint256) {
    return div(a, b, "SafeMath: division by zero");
function mod(uint256 a, uint256 b) internal pure returns (uint256) {
    return mod(a, b, "SafeMath: modulo by zero");
```

- ❖ Smart contract approves **burn** to reduce the circulating supply. Burn percentages can be modified via **setRatios()**.
- ❖ Smart contract utilizes **antisnipe** function module to allow limited transactions after a number of blocks from launch-block.

```
function isBlacklisted(address account) public view returns (bool) {
    return antiSnipe.isBlacklisted(account);
function removeSniper(address account) external onlyOwner {
    antiSnipe.removeSniper(account);
function setProtectionSettings(bool _antiSnipe, bool _antiGas, bool _antiBlock, bool _algo)
external onlyOwner {
    antiSnipe.setProtections(_antiSnipe, _antiGas, _antiBlock, _algo);
```

```
function setGasPriceLimit(uint256 gas) external onlyOwner {
    require(gas >= 100, "Too low.");
    antiSnipe.setGasPriceLimit(gas);
```

- ❖ Smart contract owner can **change transaction fees and ratios**. Maximum limits are set to allow the value change within the set parameters.

```
function setTaxes(uint16 buyFee, uint16 sellFee, uint16 transferFee) external onlyOwner {
    require(buyFee <= maxBuyTaxes
        && sellFee <= maxSellTaxes
        && transferFee <= maxTransferTaxes,
        "Cannot exceed maximums.");
    require(buyFee + sellFee <= maxRoundtripTax, "Cannot exceed roundtrip maximum.");
function setRatios(uint16 project, uint16 airdropContract, uint16 burn) external onlyOwner {
    require(_ratios.totalSwap <= total, "Cannot exceed sum of buy and sell fees.");
```

- ❖ Smart contract owner can **change max wallet limit**. Minimum limit is set to allow the value change within the set parameters.

```
function setMaxWalletSize(uint256 percent, uint256 divisor) external onlyOwner {
    require(_tTotal * percent) / divisor >= (_tTotal / 100), "Max Wallet amt must be above 1%
of total supply.);
```

- ❖ Smart contract has a **low severity issue** which may or may not create any functional vulnerability.

#### "severity": 8, (! Low Severity)

#### "Authorization through tx.origin"

- ❖ Smart contract has a **low severity issue** which may or may not create any functional vulnerability.

#### "severity": 6, (! Informational Severity)

#### "Open compiler declaration"

# Auditor's Verdict

InterFi team has performed a line-by-line manual analysis and automated review of smart contracts. Smart contracts were analyzed mainly for common contract vulnerabilities, exploits, and manipulation hacks. According to the audit:

- ❖ Skeptic Token's smart contract source code has **LOW RISK SEVERITY**
- ❖ Skeptic Token's smart contract has an **ACTIVE OWNERSHIP**
- ❖ Skeptic Token's centralization risk correlated to the active owner is **MEDIUM**

## Note for stakeholders

## Smart Contract

### Security Audit

- ❖ Be aware that active smart contract owner privileges constitute an elevated impact on smart contract safety and security.
- ❖ If the smart contract is not deployed on any blockchain at the time of the audit, the contract can be modified or altered before blockchain development. Verify contract's deployment status in the audit report.
- ❖ Make sure that the project team's KYC/identity is verified by an independent firm.
- ❖ Always check if the contract's liquidity is locked. A longer liquidity lock plays an important role in the project's longevity. It is recommended to have multiple liquidity providers.
- ❖ Examine the unlocked token supply in the owner, developer, or team's private wallets. Understand the project's tokenomics, and make sure the tokens outside of the LP Pair are vested or locked for a longer period.

# Important Disclaimer

InterFi Network provides contract development, testing, auditing and project evaluation services for blockchain projects. The purpose of the audit is to analyze the on-chain smart contract source code and to provide a basic overview of the project. **This report should not be transmitted, disclosed, referred to, or relied upon by any person for any purpose without InterFi's prior written consent.**

InterFi provides the easy-to-understand assessment of the project, and the smart contract (otherwise known as the source code). The audit makes no statements or warranties on the security of the code. It also cannot be considered as enough assessment regarding the utility and safety of the code, bug-free status, or any other statements of the contract. While we have used all the data at our disposal to provide the transparent analysis, it is important to note that you should not rely on this report only – we recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contracts. **Be aware that smart contracts deployed on a blockchain aren't resistant to external vulnerability, or a hack. Be aware that active smart contract owner privileges constitute an elevated impact on smart contract safety and security. Therefore, InterFi does not guarantee the explicit security of the audited smart contract.**

The analysis of the security is purely based on the smart contracts alone. No applications or operations were reviewed for security. No product code has been reviewed.

**This report should not be considered as an endorsement or disapproval of any project or team.** The information provided in this report does not constitute investment advice, financial advice, trading advice, or any other sort of advice and you should not treat any of the report's content as such. Do conduct your due diligence and consult your financial advisor before making any investment decisions.

# About InterFi Network

InterFi Network provides intelligent blockchain solutions. InterFi is developing an ecosystem that is seamless and responsive. Some of our services: Blockchain Security, Token Launchpad, NFT Marketplace, etc. **InterFi's mission is to interconnect multiple services like Blockchain Security, DeFi, Gaming, and Marketplace under one ecosystem that is seamless, multi-chain compatible, scalable, secure, fast, responsive, and easy to use.**

InterFi is built by a decentralized team of UI experts, contributors, engineers, and enthusiasts from all over the world. Our team currently consists of 6+ core team members, and 10+ casual contributors. **InterFi provides manual, static, and automatic smart contract analysis, to ensure that project is checked against known attacks and potential vulnerabilities.**
